Structural Design Aspects

The core of underground RCC water tank design lies in its structural elements, which include walls, base slab, roof slab (if applicable), and inlet/outlet structures.

Design of Tank Walls

- Thickness: Typically ranges from 200 mm to 600 mm depending on height and soil conditions.
- Reinforcement: Both longitudinal and transverse reinforcement are essential. Reinforcement details are based on bending and shear stresses.
- Reinforcement Detailing: Provide adequate cover to prevent corrosion, and use reinforcing steel compliant with standards like IS 456:2000.

Design of Base Slab

- Thickness: Usually ranges from 300 mm to 600 mm.
- Load Considerations: Must handle soil pressure, water pressure, and live loads.
- Reinforcement: Distributed reinforcement to resist bending moments due to hydrostatic pressure.

Design of Roof Slab (if applicable)

- For tanks with an accessible roof, design considerations include load-bearing capacity, waterproofing, and insulation if needed.

Inlet, Outlet, and Overflow Structures

- Design of inlet pipes, outlets, and overflow pipes should prevent turbulence, minimize contamination, and facilitate maintenance.
- Adequate sealing and waterproofing around openings are critical.

Hydrostatic and Soil Pressure Calculations

The tank must withstand the pressure exerted by the stored water and surrounding soil.

Hydrostatic Pressure

- Calculated as $P = \rho g h$, where:
- ρ = density of water ($\sim 1000 \text{ kg/m}^3$)
- g = acceleration due to gravity (9.81 m/s^2)
- h = height of water column

- Maximum pressure occurs at the bottom of the tank, requiring reinforcement and wall thickness to be designed accordingly.

Soil Pressure

- Assessed using earth pressure theories such as Rankine or Coulomb.
