## Sample Assessment Questions and Answers

Below are some typical questions from chemistry unit 5 assessments with detailed answers to help guide your study.

### Question 1: Describe the trend in atomic radius across a period in the periodic table.

**Answer:** The atomic radius decreases across a period from left to right. This trend occurs because additional protons are added to the nucleus, increasing the nuclear charge. The increased positive charge pulls the electrons closer to the nucleus, resulting in a smaller atomic size. Although electrons are added to the same energy level, the stronger attraction pulls the outer electrons inward, reducing the radius.

### Question 2: Explain the difference between ionic and covalent bonding with examples.

**Answer:** Ionic bonding involves the transfer of electrons from one atom to another, resulting in the formation of oppositely charged ions. Typically, this occurs between metals and non-metals. For example, sodium chloride (NaCl) forms through ionic bonding where sodium donates an electron to chlorine.

Covalent bonding involves the sharing of electrons between atoms, usually non-metals. An example is water (H<sub>2</sub>O), where oxygen shares electrons with hydrogen atoms to form stable molecules.

### Question 3: Calculate the number of moles in 24 grams of carbon dioxide (CO<sub>2</sub>).

- Step 1: Find the molar mass of CO<sub>2</sub>:

$$\text{C (12 g/mol)} + 2 \times \text{O (16 g/mol)} = 12 + 32 = 44 \text{ g/mol}$$

- Step 2: Use the formula for moles:

$$\text{Number of moles} = \text{mass} / \text{molar mass} = 24 \text{ g} / 44 \text{ g/mol} = 0.545 \text{ mol}$$

**Question 4: Write a balanced chemical equation for the combustion of methane.**

**Answer:** The unbalanced equation is:

It is already balanced as written, with 1 carbon, 4 hydrogens, and 2 oxygens on each side.

**Question 5: Describe how acids react with metals to produce salts.**

**Answer:** Acids react with metals that are more reactive than hydrogen, leading to the formation of a salt and hydrogen gas. For example, hydrochloric acid reacts with magnesium:

This reaction demonstrates acid-metal displacement, where the metal displaces hydrogen from the acid to form a salt.

## Deep Dive into Key Topics and Their Answers

### Organic Structures and Nomenclature

Question: Draw the structure and provide the IUPAC name for 2-methylpropane.

Answer:

The compound 2-methylpropane is a branched alkane with a methyl group attached to the second carbon of propane. Its structure can be depicted as:

The IUPAC name is 2-methylpropane (also known as isobutane).

Key points:

- The longest chain has three carbons (propane).
- A methyl group replaces a hydrogen at the second carbon.
- The name follows IUPAC conventions, emphasizing the substituent position.

Tip: Remember that in naming branched alkanes, always identify the longest chain first and then number substituents to give the lowest possible numbers.

### Types of Organic Reactions

Question: Describe the mechanism of the nucleophilic substitution reaction between bromomethane and hydroxide ions.

Answer:

This reaction typically proceeds via an SN2 mechanism under suitable conditions. The steps are:

- Nucleophile Approach: The hydroxide ion (OH<sup>-</sup>), a strong nucleophile, approaches the electrophilic carbon atom bonded to bromine in bromomethane.
- Back-Side Attack: The hydroxide attacks the carbon from the opposite side of the leaving group (bromine).

- Transition State Formation: As the bond forms, the C-Br bond begins to break, creating a pentavalent transition state.

- Leaving Group Departure: Bromide ion ( $\text{Br}^-$ ) departs, resulting in the formation of methanol ( $\text{CH}_3\text{OH}$ ).

Reaction:

Key features:

- $\text{S}_\text{N}2$  mechanism involves a single concerted step.
- The reaction rate depends on both the substrate and nucleophile concentration.
- It occurs more readily with primary alkyl halides like bromomethane.

### Isomerism in Organic Chemistry

Question: Explain the difference between structural isomers and stereoisomers with examples.

Answer:

Structural Isomers:

These compounds have the same molecular formula but differ in the connectivity of their atoms.

Example:

- Butane ( $\text{C}_4\text{H}_{10}$ ) has two structural isomers: n-butane and isobutane (2-methylpropane).

Stereoisomers:

Compounds with the same structural formula and connectivity but differ in the spatial arrangement of their atoms.

Example:

- But-2-ene exists as cis-but-2-ene and trans-but-2-ene, which are geometric stereoisomers.

Differences:

- Structural isomers differ in how atoms are connected.
- Stereoisomers differ in three-dimensional arrangement without changing connectivity.

Understanding these distinctions is vital for predicting chemical behavior and biological activity.

## Analytical Techniques in Organic Chemistry

### Chromatography and Separation

Question: How does gas chromatography separate mixtures of organic compounds?

Answer:

Gas chromatography (GC) separates compounds based on their volatility and interaction with the stationary phase. The process involves:

- Injection: The mixture is vaporized and injected into a column containing a stationary phase.
- Travel through the Column: Compounds partition between the mobile gas phase and the stationary phase. More volatile compounds or those with weaker interactions move faster.
- Detection: As compounds exit the column, detectors record their presence, producing a chromatogram with peaks representing each component.

Key factors influencing separation:

- Compound polarity
- Boiling points
- Stationary phase characteristics

GC is invaluable for analyzing complex mixtures, such as petroleum products or pharmaceutical compounds.
