algebraic topology 636 homework 7 solutions is a topic that resonates deeply with students and researchers dedicated to understanding the profound connections between algebra and topology. This particular homework set often challenges students to apply core concepts such as homotopy, homology, and fundamental groups to complex topological spaces. In this article, we will explore comprehensive solutions to Homework 7 from the Algebraic Topology 636 course, providing detailed explanations and insights to aid your understanding and mastery of the subject.

Overview of Algebraic Topology 636 Homework 7

Before delving into the solutions, it is essential to understand the context and the types of problems presented in Homework 7. Typically, this homework set emphasizes advanced applications of homology and homotopy theories, including computations of homology groups, analysis of covering spaces, and applications of the Seifert-van Kampen theorem.

Homework 7 often comprises problems such as:

- Computing homology groups of specific spaces.
- Determining fundamental groups of topological spaces.
- Analyzing the properties of covering spaces.
- Applying Mayer-Vietoris sequences to compute homology.

Understanding these core themes is crucial, as they form the backbone of the solutions discussed below.

Problem 1: Computing Homology Groups of a Wedge of Spheres

Problem Statement

Compute the singular homology groups $H_n(X)$ where $X = S^k \vee S^l$, the wedge sum of two spheres with dimensions k and l .

Solution Approach

The computation hinges on understanding how homology behaves with respect to wedge sums. The

key tool here is the wedge sum's effect on homology, which is well-understood in algebraic topology.

Step 1: Recall the Reduced Homology of Spheres

- For a sphere (S^n) :

[

$\widetilde{H}_m(S^n) =$

$\begin{cases}$

$\mathbb{Z}, \text{ \& } m = n \text{ \& } \\$

$0, \text{ \& } m \neq n$

$\end{cases}$

]

Step 2: Use the Wedge Sum Property

- The reduced homology of a wedge sum $(X \vee Y)$ satisfies:

[

$\widetilde{H}_n(X \vee Y) \cong \widetilde{H}_n(X) \oplus \widetilde{H}_n(Y)$

]

for all (n) .

Step 3: Compute $(H_n(X))$

- Since the homology groups of spheres are known, the wedge sum's homology groups are:

[

$$H_n(S^k \vee S^l) \cong$$

$$\begin{cases}$$

$$\mathbb{Z}, \text{ \& } n = k \text{ \textit{ or } } n = l \text{ \& }$$

$$0, \text{ \& } \textit{otherwise}$$

$$\end{cases}$$

$$\text{\\}$$

- For the full (non-reduced) homology, note that:

$$\text{\\}$$

$$H_0(X) \cong \mathbb{Z}$$

$$\text{\\}$$

since (X) is path-connected.

- For $(n \geq 1)$:

$$\text{\\}$$

$$H_n(X) \cong \widetilde{H}_n(X) \cong$$

$$\begin{cases}$$

$$\mathbb{Z} \oplus \mathbb{Z}, \text{ \& } n = k = l \text{ \& }$$

$$\mathbb{Z}, \text{ \& } n = k \neq l \text{ \textit{ or } } n = l \neq k \text{ \& }$$

$$0, \text{ \& } \textit{otherwise}$$

$$\end{cases}$$

$$\text{\\}$$

Final Result:

$\lfloor$

$$H_n(S^k \vee S^l) \cong$$

$\begin{cases}$

$$\mathbb{Z}, \text{ \& } n=0 \setminus \setminus$$

$$\mathbb{Z} \oplus \mathbb{Z}, \text{ \& } n = k = l \setminus \setminus$$

$$\mathbb{Z}, \text{ \& } n = k \neq l \text{ \textit{ or } } n = l \neq k \setminus \setminus$$

$$0, \text{ \& } \textit{otherwise}$$

$\end{cases}$

$\rfloor$

This solution showcases how wedge sums of spheres influence the homology groups, illustrating the additive nature of reduced homology.

Problem 2: Fundamental Group of a Wedge of Circles

Problem Statement

Determine the fundamental group $\pi_1 \left(\bigvee_{i=1}^n S^1 \right)$.

Solution Approach

The wedge sum of (n) circles, often called a bouquet of (n) circles, is a classic example in algebraic topology. Its fundamental group is known to be a free group on (n) generators.

Step 1: Recognize the Space

- The space $X = \bigvee_{i=1}^n S^1$ can be visualized as (n) circles joined at a single point.

Step 2: Use the Seifert-van Kampen Theorem

- The theorem allows the calculation of the fundamental group for spaces constructed as unions with intersection.

- Since the wedge of circles can be constructed by taking (n) copies of (S^1) and identifying a point, the fundamental group is the free product of the individual groups, which for circles is $(\mathbb{Z})$.

Step 3: Fundamental Group Calculation

- The fundamental group of a circle:

$$\pi_1(S^1) \cong \mathbb{Z}$$

- The wedge sum of (n) circles has a fundamental group:

$$\pi_1\left(\bigvee_{i=1}^n S^1\right) \cong \ast_{i=1}^n \pi_1(S^1) \cong F_n$$

where (F_n) is the free group on (n) generators.

Final Result:

$$\pi_1\left(\bigvee_{i=1}^n S^1\right) \cong F_n$$

This aligns with the intuition that loops around each circle generate independent elements, and no relations exist other than those dictated by the free group structure.

Problem 3: Covering Space of a Torus

Problem Statement

Describe all connected covering spaces of the torus $(T^2 = S^1 \times S^1)$.

Solution Approach

The classification of covering spaces relies on the fundamental group of the base space. Since the torus (T^2) has a well-understood fundamental group, this problem becomes manageable.

Step 1: Fundamental Group of the Torus

- The fundamental group:

$$\pi_1(T^2) \cong \mathbb{Z} \times \mathbb{Z}$$

Step 2: Covering Spaces Correspond to Subgroups

- Covering spaces correspond to conjugacy classes of subgroups of $(\pi_1(T^2))$.
- Since $(\pi_1(T^2))$ is abelian, conjugacy classes are just subgroups.

Step 3: Classify Subgroups

- All subgroups of $(\mathbb{Z} \times \mathbb{Z})$ are of the form:

$$H_{\{m,n\}} = m\mathbb{Z} \times n\mathbb{Z}$$

for $(m, n \in \mathbb{N})$, possibly infinite.

- The index of $(H_{m,n})$ in $(\mathbb{Z} \times \mathbb{Z})$ is (mn) .

Step 4: Corresponding Covering Spaces

- Each subgroup $(H_{m,n})$ corresponds to a covering space $(\tilde{T}^2)$ with:

$[$

$$\pi_1(\tilde{T}^2) \cong H_{m,n}$$

$]$

- The covering space is topologically a torus (T^2) "wrapped" (m) and (n) times around the base torus in each direction.

Final Result:

- All connected covering spaces of (T^2) are tori (T^2) with fundamental groups $(H_{m,n})$, i.e., the degree (mn) covers.

- The universal cover corresponds to $(H_{1,1} = \mathbb{Z} \times \mathbb{Z})$, which is simply (T^2) itself, indicating the universal cover is $(\mathbb{R}^2)$.

Problem 4: Mayer-Vietoris Sequence for a Decomposition

Problem Statement

Use the Mayer-Vietoris sequence to compute the homology groups of the wedge of two spaces $(X = A \cup B)$, where (A) and (B) are subspaces with known homology.

Solution Approach

The Mayer-Vietoris sequence is a powerful tool for computing the homology of complicated spaces via simpler subspaces.

Step 1: Recall the Mayer-Vietoris Sequence

- For spaces $(A, B \subseteq X)$ with $X = A \cup B$

The solutions to Homework 7 exemplify best practices in mathematical exposition, emphasizing transparency, logical progression, and contextual understanding. For students, engaging with these solutions can:

- Reinforce understanding of complex algebraic techniques
- Illustrate the interconnectedness of topological invariants
- Improve problem-solving skills through example-driven learning
- Prepare for research-level applications where similar methods are employed

For instructors, these solutions serve as models for designing effective feedback and guiding students through intricate arguments.

Challenges and Limitations

Despite their strengths, the solutions are not without limitations:

- Assumed Background Knowledge: They often presuppose familiarity with advanced concepts, potentially alienating less experienced students.
- Potential for Oversimplification: Some steps may omit subtle details necessary for complete understanding.
- Variability in Detail: Not all solutions exhibit uniform depth, which can lead to confusion or gaps in comprehension.

Addressing these challenges involves supplementing the solutions with additional explanations, background material, and contextual examples.

Experiments in Topology Dover Books on Mathematics: Exploring the Fascinating World of Shape and Space

Introduction

Experiments in topology Dover books on mathematics serve as an invaluable resource for students, educators, and enthusiasts eager to delve into the intriguing realm of topology—a branch of mathematics concerned with the properties of space that are preserved under continuous deformations. Dover Publications, renowned for their affordable and comprehensive mathematical texts, has long been a trusted publisher offering a rich selection of books that make complex concepts accessible. In this article, we explore the significance of Dover's topology titles, their pedagogical approach, and how these books facilitate experimental learning and discovery in the

abstract yet captivating universe of topology.

Understanding Topology: The Mathematical Frontier of Flexibility

Topological concepts often challenge our intuitive understanding of space. Unlike Euclidean geometry, which emphasizes measurements and angles, topology emphasizes qualitative properties such as connectedness, continuity, and boundary that remain invariant under stretching or bending. This perspective has profound implications across various fields, from physics and computer science to biology and art.

In essence, topology asks questions like:

- What makes a coffee mug topologically equivalent to a donut?
- How can continuous deformations illustrate complex knot structures?
- What are the fundamental invariants that classify different types of spaces?

Dover's topological texts approach these questions with clarity, encouraging readers to experiment mentally and practically with the concepts.

Dover's Topology Series: Bridging Theory and Experiment

Dover publishes several noteworthy titles in the field of topology, each designed to serve a different level of expertise from beginners to advanced scholars. These books often combine rigorous mathematical treatment with accessible language, illustrative diagrams, and hands-on exercises, fostering an experimental approach to learning.
