What Are Longitudinal Waves?

Definition of Longitudinal Waves

Longitudinal waves are a type of wave where particle displacement is parallel to the direction of wave propagation. Unlike transverse waves, which oscillate perpendicular to the direction of travel (like waves on a string), longitudinal waves involve compressions and rarefactions traveling through a medium such as air, water, or solids.

Examples of Longitudinal Waves

- Sound waves in air
- Seismic P-waves during earthquakes
- Ultrasound waves used in medical imaging

Key Characteristics

- Particle motion is parallel to wave travel
- Consist of alternating regions of compression and rarefaction
- Can travel through solids, liquids, and gases
- Typically transfer energy without transferring matter

Purpose of the Gizmo Answer Key

The answer key provides explanations for the typical questions posed in the simulation activities, helping students verify their understanding and approach problem-solving systematically.

Common Questions and Answers from the Gizmo Longitudinal Waves Activity

- What is the relationship between wave speed, frequency, and wavelength?

Answer:

The fundamental relationship among wave speed (v), frequency (f), and wavelength (λ) is expressed by the equation:

$$v = f \times \lambda$$

- Wave speed (v): How fast the wave propagates through the medium.
- Frequency (f): How many wave cycles pass a fixed point per second.
- Wavelength (λ): The distance between successive compressions or rarefactions.

In the Gizmo simulation, increasing the frequency while keeping the wavelength constant results in a higher wave speed, and vice versa.

- How do changes in amplitude affect the wave?

Answer:

Amplitude in the Gizmo simulation represents the maximum displacement of particles during wave oscillation. Increasing the amplitude results in:

- Larger compressions and rarefactions
- Greater energy transfer
- No change in the wave's speed or wavelength

Conversely, decreasing amplitude produces smaller wave displacements but does not impact the wave's speed or frequency.

- What is the significance of compression and rarefaction in longitudinal waves?

Answer:

Compression and rarefaction are the regions where particles are densely packed or spread apart, respectively.

- Compression: Particles are close together, representing high pressure zones.
- Rarefaction: Particles are spread apart, representing low pressure zones.

These alternating regions propagate through the medium, transmitting energy from the source to the receiver.

- How does changing the wave's wavelength affect its speed?

Answer:

In the context of the Gizmo simulation, when you modify the wavelength:

- Keeping the frequency constant, increasing λ results in a higher wave speed.
- If the medium remains unchanged, the wave speed remains constant regardless of wavelength, as per the wave speed formula.

This emphasizes that in a given medium, wave speed is usually constant; changing wavelength and

frequency adjusts the wave's appearance but not the transmission speed unless the medium itself changes.

- How does the medium affect wave transmission?

Answer:

The medium's properties such as density and elasticity influence wave speed:

- Elasticity: More elastic materials allow faster wave propagation.
- Density: Denser materials generally slow down wave speed.

In the Gizmo simulation, selecting different media (like air, water, or solids) demonstrates how wave speed varies based on medium characteristics.
