Sample Questions and Detailed Answers

Question 1: Write a function that reverses a string.

Example Input: "hello"

Expected Output: "olleh"

Solution:

```javascript
function reverseString(str) {
return str.split('').reverse().join('');
}
```

Explanation: The function splits the string into an array of characters, reverses the array, and joins it back into a string.

Question 2: Find the largest number in an array.

Example Input: [3, 5, 7, 2, 8]

Expected Output: 8

Solution:

```javascript
function findLargestNumber(arr) {
return Math.max(...arr);
}
```

Explanation: Using the spread operator, Math.max returns the maximum value in the array.

Question 3: Check if a string is a palindrome.

Example Input: "racecar"

Expected Output: true

Solution:

```javascript
function isPalindrome(str) {
const reversed = str.split('').reverse().join('');
return str === reversed;
}
```

```

Explanation: The function compares the original string to its reversed version to determine if it's a palindrome.

## Question 4: Write a function that filters out odd numbers from an array.

Example Input: [1, 2, 3, 4, 5]

Expected Output: [2, 4]

### Solution:

```javascript

function filterEvenNumbers(arr) {

return arr.filter(num => num % 2 === 0);

}

```

Explanation: The filter method creates a new array with only even numbers.

Question 5: Implement a function to debounce a click event.

Debouncing prevents a function from being called too frequently.

Solution:

```javascript

function debounce(func, delay) {

let timeoutId;

return function(...args) {

clearTimeout(timeoutId);

```
timeoutId = setTimeout(() => {

func.apply(this, args);

}, delay);

};

}
```

Explanation: The debounce function delays the execution of the passed function until after a specified delay has passed without new calls.

- Writing clean, readable code

Expert Tip: Use modern syntax to write efficient and maintainable code.

Common Types of Questions and How to Approach Them

Understanding question formats helps prepare effectively. Here are common categories:

Multiple Choice Questions (MCQs)

These test theoretical understanding. Examples include:

- Identifying correct syntax
- Choosing the output of a code snippet
- Recognizing best practices

Strategy: Read questions carefully, eliminate obviously wrong answers, and rely on core knowledge.

Code Writing Challenges

Candidates are asked to write functions, implement algorithms, or debug code snippets.

Strategy:

- Break down the problem into smaller parts.
- Write pseudocode before actual coding.
- Test your code with different inputs.
- Use comments to clarify your logic.

Debugging Tasks

You may be given flawed code and asked to identify and fix errors.

Strategy:

- Read the code carefully.
- Understand the intended logic.
- Check for common issues like syntax errors, logical flaws, or incorrect variable usage.

Sample Questions and Answers

While actual test questions are proprietary, here are representative examples with detailed explanations:

Question 1: Variable Scope

What will be the output of the following code?

```javascript

function testScope() {

if (true) {

var x = 'hello';

}

console.log(x);

}

testScope();

```

Answer:

`hello`

Explanation:

- The variable `x` is declared with `var`, which is function-scoped.
- Even though it?s inside an `if` block, `x` is accessible throughout the `testScope` function.
- Therefore, `console.log(x)` outputs `'hello'`.

Question 2: Array Method

What does the following code output?

```javascript

const numbers = [1, 2, 3, 4, 5];

const result = numbers.filter(n => n % 2 === 0);

console.log(result);

```

Answer:

`[2, 4]`

Explanation:

- The `filter()` method creates a new array with elements that satisfy the condition.
- `n % 2 === 0` filters out even numbers.
- The resulting array contains `[2, 4]`.

Question 3: Asynchronous Fetch

Fill in the blanks to fetch data from an API and log it:

```javascript

async function fetchData() {

const response = await fetch('https://api.example.com/data');

const data = await response.____();
```

```
console.log(data);

}

fetchData();
```

Answer:

`json`

Complete code:

```javascript
async function fetchData() {

const response = await fetch('https://api.example.com/data');

const data = await response.json();

console.log(data);

}

fetchData();
```

Explanation:

- `response.json()` parses the response body as JSON.
- The `await` keyword ensures the promise resolves before proceeding.
